PROJECTS

Hospital Offline web App — To manage all the hospital departments, done with the help of an Algerian colleague.

[Linguistic Company website](#) — To show its different services. It was a multilanguage and responsive website.

Douaa web App — The user enters his relative / friend's name, and if he is dead or ill, then choose a desired douaa for him to share among many douaas entered before by the web app admin.

Nasiha web App — I created this app as a self project, but lack of resources made me unable to serve it for a longer time. It was a web app built with codeigniter framework, as a forum has the functionality of register, login, posting, commenting, liking and many more.

Micro service web App — I built it from scratch, to make myself more able to understand and update every single code.

[My personal website](#) — It's served on neocities.org, which does not provide any form of server side rendering, it only gives the ability to use HTML, CSS, JavaScript. Despite of that, I managed to make it dynamic somehow with the help of JavaScript and Google Drive.

WebScraping App — I created this app for my personal use, I was working as a freelance translator, I needed some dictionaries which were free on the web, but wasn't in any downloadable forms, so I wrote a Python program to scrap the site and get my desired dictionaries in a .xlsx format.

Files names changing app — I had more than 10 thousand folders, every folder has a pdf file inside, I had to swap names of the folder and the file, instead of doing it manually spending more than 3 months from my life, I did it with only one click with a Python lite app.
